

Anonymisation diagnostic: measuring what instruction tuning installs

Each condition is trained and scored as a **separate arm**; every layer except Surface-Form Control is identical across arms. The contribution is not a model but a **measurement**: one extra training run turns a single accuracy into a decomposition, and the pair (accuracy, gap) replaces accuracy as the unit of reporting.

Results shown for YAGO3-10, 50-way filtered link prediction. Scope: one backbone at 1.5B parameters, single seed, 500 ranking queries.
